RAD (Rapid Application Development)

RAD (Rapid Application Development) is a software development methodology that emphasizes quick development and iteration of prototypes over strict planning and long development cycles. It is ideal for projects where requirements evolve through user feedback and where fast delivery is important.

Key Characteristics of RAD:

• Focus on prototypes instead of extensive documentation
• User involvement throughout the development process
• Fast development cycles with frequent iterations
• Reusable components to reduce effort
• Best suited for UI/UX-intensive projects like web and mobile apps

Phase 1: Requirements Planning

This is where the project goals, system requirements, and user needs are identified. Stakeholders, users, and designers collaborate to decide what needs to be built.

1) Identify Key Features

Navigation:
• Home
• Product Categories (Men, Women, Electronics)
• Product Listings
• Product Details
• Cart
• Checkout
• Order Confirmation

User Actions:
Browsing, Searching, Adding to Cart, Viewing Products, Checkout, Payment, Tracking Orders

2) Create a Requirements Document:

1. View list of product categories
2. View products under each category
3. View detailed information about a product
4. View and edit cart
5. Checkout and enter user/shipping/payment details
6. View order confirmation message

Phase 2: User Design

Designers and users collaborate to create wireframes and prototypes. The idea is to show how the application will look and behave before any actual coding starts.

1) Tools Used:

Axure RP – Used to design the wireframes and UI prototype

2) Wireframes Designed:

• **Home Page:** Highlights offers, includes search bar and navigation menu
• **Product Categories:** Lists Men, Women, and Electronics sections
• **Product Listings:** Shows products like jeans, shirts, shoes, watches
• **Product Details:** Displays product information with “Add to Cart” and “Buy Now” options
• **Cart:** Shows added items with price and quantity details
• **Checkout:** Collects shipping and payment information
• **Order Confirmation:** Confirms successful order placement

3) Design Implementation:

• Designed interactions and navigation using Axure’s Prototype mode
• Reused components like headers and buttons
• Annotated elements for clarity (e.g., button actions, purpose of sections)

Phase 3: Construction

This is where the actual development happens, but in RAD, it is tightly coupled with ongoing testing and feedback. The prototype is refined based on user responses.

1) Interactive Prototypes:
• Created using Axure's prototype linking features
• Functional paths designed:
Home → Product Categories → Product Listings → Product Details → Add to Cart → Checkout → Order Confirmation

2) Dynamic Elements:
• Simulated button interactions and transitions
• Screens simulate real-time navigation between product pages and cart
• Cart updates and checkout flow are represented

3) Testing and Iteration:
• Prototype previewed using Axure Preview mode
• Feedback considered for improving UI and usability
• Iterations made based on layout, clarity, and user experience

Phase 4: Cutover

In this final phase, the system is finalized and prepared for deployment or presentation.

1) Finalization and Export:
• Final design prototype completed
• Ready for hand-off to development team
• Can be exported as HTML or shared via Axure Cloud

2) User Training & Support:
• Walkthrough of the prototype provided
• Documentation explains user flow and functionality
• Easy for developers to understand and implement
